

# Stack Overflow On-Chain

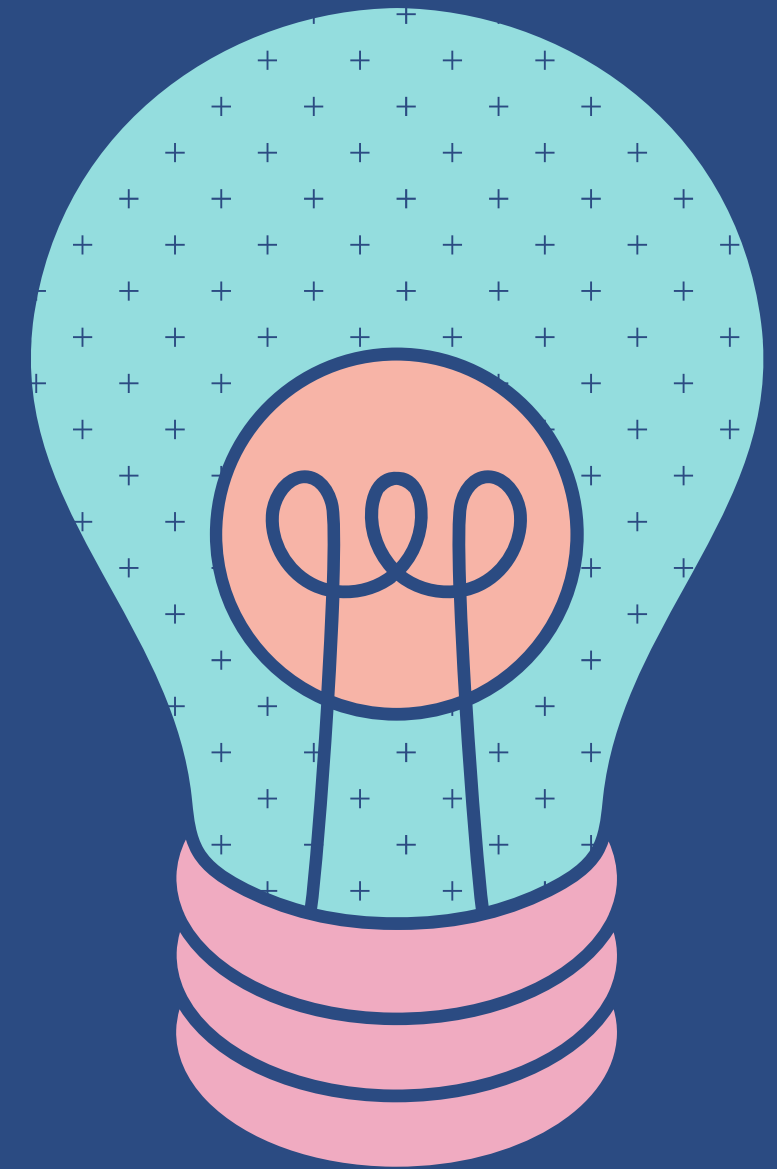

Built using Avalanche, IPFS and Moralis

# Decentralized Applications are the next big thing

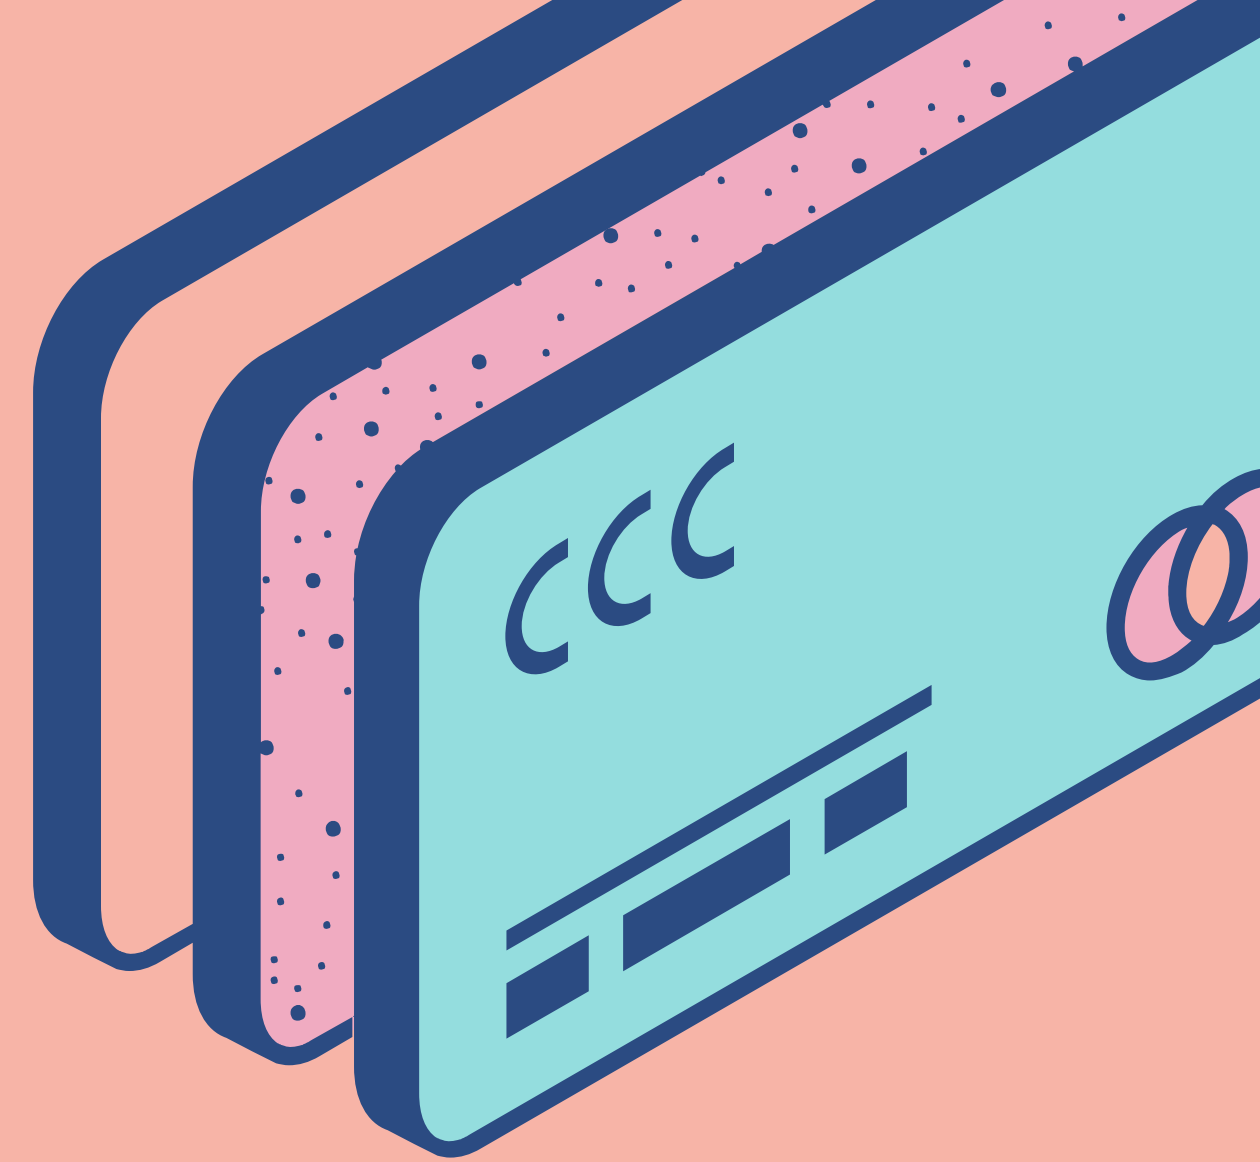

The current boom of Blockchain technology has given rise to this new space and has coined a new word "Dapps" (Decentralized Applications) and Web3 is all about it.

The idea of this project is to build a clone of the existing Stack Overflow website and make it decentralized and add more features to enhance it.

# Features of Decentralized Stack Overflow

## Decentralized Data

The metadata of each post gets stored in IPFS and then is stored on Avalanche Blockchain.

## Donate Feature

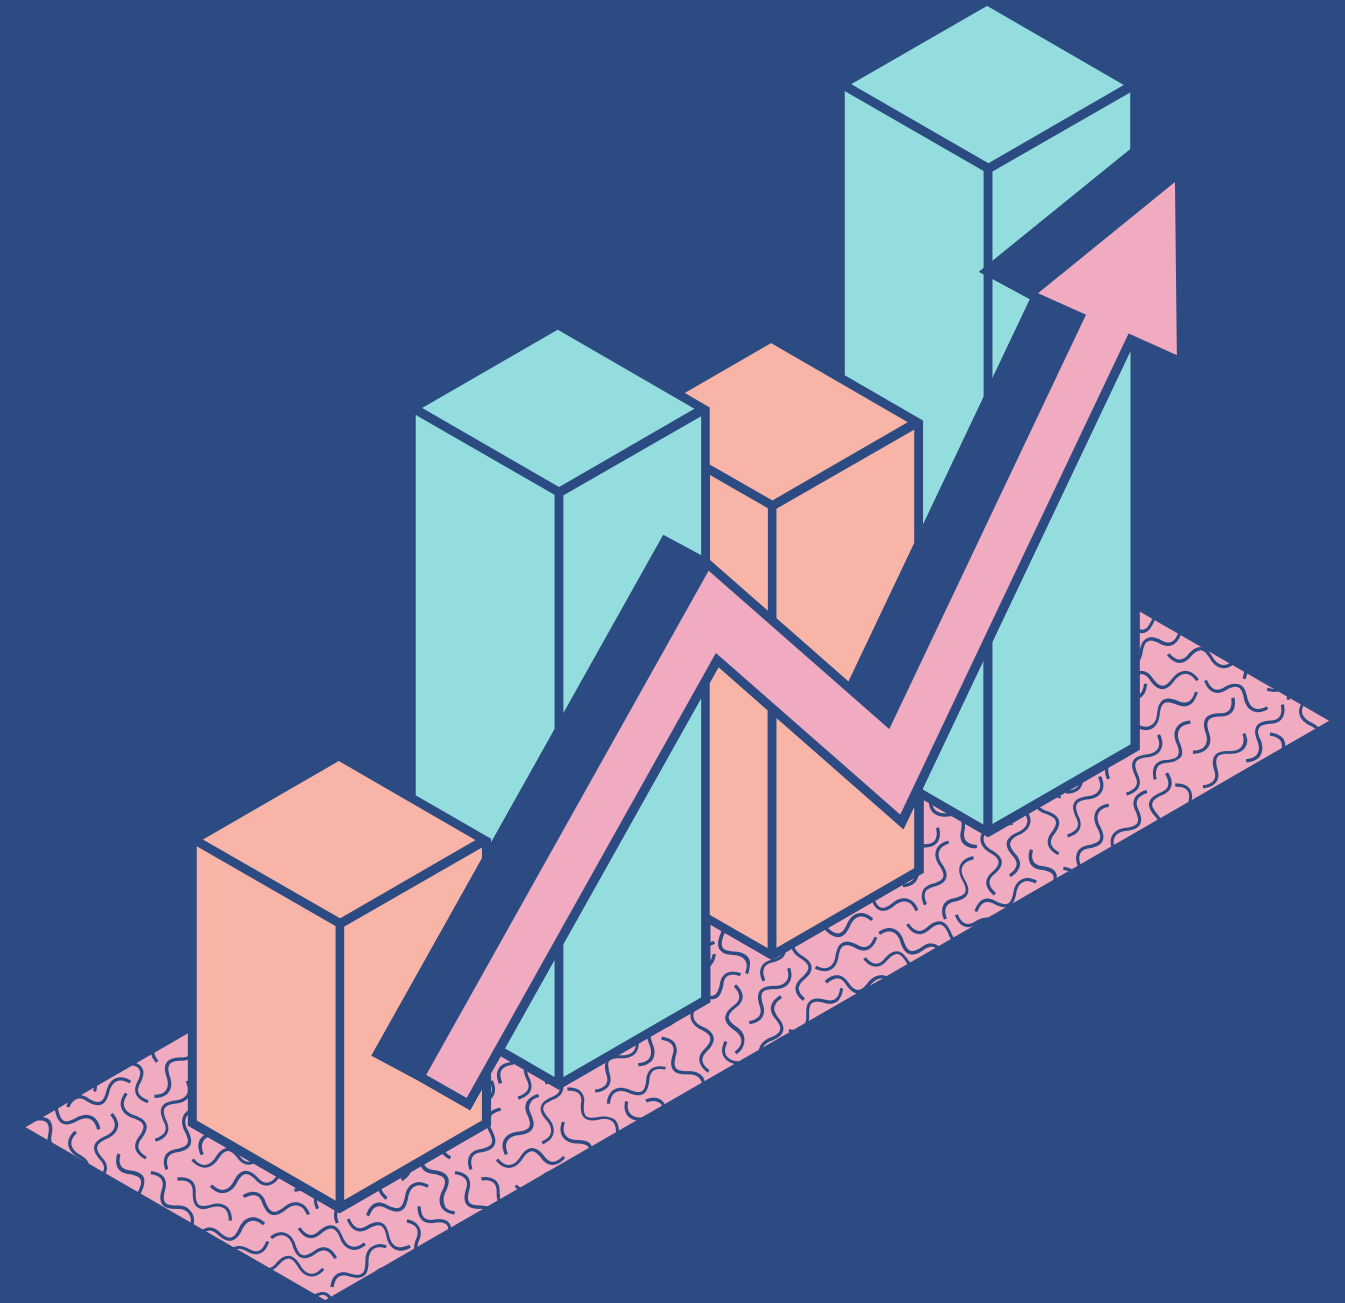

Users can donate crypto to the answers they like and this way the helpers get paid for their service

## Privacy and Free for all

Your wallet is your identity and no restrictions of any kind as the complete website is handled by a smart contract.

# Market Strategy

- Get more users to the product
- Increase the amount of features
  - Enhance the UI

# Thank you
